

RELAYING OF MESSAGES

ABSTRACT

A method, apparatus, system, and signal-bearing medium that in an embodiment detect that a connection is lost while a call is in progress, prompt for a message in
5 response to the detection, and save the message until the connection is available. After the connection is available, the message is automatically sent to the party to the call. In this way, information that was cut off when the connection was lost can be completed in an convenient manner. In another embodiment, the user may enter a message or
10 messages for a designated recipient or recipients at any time, and the message(s) is saved and automatically sent when the connection becomes available.
